A: Methodology

The following section complements the paper by providing an expanded description of the search process. Table A1 outlines the exact search strings used in each library. Tables A2 and A3 outlines the Eligibility Criteria for basic income articles, and for a subset of gender articles, respectively.

Our search identified 2126 items, which were imported into Zotero reference management software, where missing information (e.g. author, date) was manually added. In Zotero, 1027 duplicate articles were automatically detected and removed manually, along with 50 ineligible, non-English language articles.

Table A1: Search Strings

Database	Description	Search String & Filters	Reports found
Business Source Premier - EBSCOhost	Contains more than 2.2 thousand journals with a particular focus on business and economics	(TI=("basic income")) OR AB=("basic income") Filters: Article, Academic Journal, Peer Reviewed, English.	396
ProQuest - All Databases	42 databases, include PAIS, IBSS, Proquest Social Science	(TI=("basic income")) OR AB=("basic income") Filters: Scholarly Journals, Article, English, Peer Reviewed	968
Web of Science Core Collection	Over 22 thousand peer reviewed journals.	(TI=("basic income")) OR AB=("basic income") Filters: Article, English	763

Table A2: Eligibility Criteria for Basic Income Articles

	Inclusion	Exclusion
Centrality	Basic Income is a central or main theme of the article, including for example where it is being evaluated against another policy solution.	Basic income was only briefly mentioned, or where basic income was one of three or more policy solutions being evaluated. Basic income was not mentioned in the title or abstract, but may have been included in the search results as ‘basic income’ was mentioned in keywords. (201 articles excluded)
Concept matching	“Basic income” refers to the concept of universal basic income as defined by Basic Income Earth Network (BIEN):: a universal, individual, periodic cash payment unconditionally delivered on an individual basis, without means-test or work requirement.(BIEN, 2026).	‘Basic income’ didn’t refer to the BIEN description. For example, it was synonymous with subsistence income, or to means-tested welfare payments (for example, as was often the case in literature about Germany). (123 articles excluded)
Eligibility	Peer reviewed, English language articles.	Items which were not peer-reviewed journal articles (including book reviews, non-peer reviewed contributions, book chapters), and articles which were not available in English. We excluded ‘features’ as this tended to result in repetition, features being both articles and features, while also including too many non-academic, non-peer-reviewed articles. We relied on the filters available from the databases for this purpose. (96 articles excluded)

To ascertain the extent to which the BI literature addresses gender we manually identified a subset of articles which meaningfully address gender. During the double-blind screening process, reviewers individually coded articles which were related to gender. Specifically, each reviewer applied the keyword search developed in [Authors (Year)] to identify articles relating to gender in basic income research: “feminis*, wom*n, gender, caregiving, care work”. The search was applied to titles and abstracts. Inclusion and exclusion criteria are summarised in **Table A3**. Where conflicts existed, these were discussed and resolved between reviewers, and where required, a full text scan was conducted. 44 ‘gender’ articles were identified.

Table A3: Eligibility Criteria for Basic Income and Gender Articles

	Inclusion	Exclusion
Centrality	Gender (in all dimensions) or women (alongside basic income) are a primary focus of the article.	The article disaggregates data between different genders, but doesn’t look more deeply (“add gender and stir”). The keywords are mentioned, but gender is not the focus of the article.

Table A4: Metadata Sources

Metadata	Source	Notes
Gender	Genderize.io	
Citation Count Cited Reference Counts	Web of Science	Available for 408 articles
Journal Impact Factor	Clarivate	Calculated for journal at year of publication. Available for 297 articles

B: Gender Publishing Gaps by Discipline

Table B1: Gender publishing gap by disciplines

Discipline	Percentage of journal articles written by women	Region	% Female Full Professorships
Corpus	32% (28.5% weighted)	UK	30.8% (AdvanceHE, 2024)
Economics	14% (Bayer and Rouse, 2016)	Germany	27% (Statistisches Bundesamt, 2022)
Philosophy	12–16% (Bayer and Rouse, 2016; Wilhelm et al., 2017)	US	Maths intensive fields: 7% - 16% Psychology: 35% Social science, excluding economics: 23% Life sciences: 24% (Ceci et al., 2014)
Political science	26–27% (Teele and Thelen, 2017)	EU	26.2% (European Commission, 2021)
Sociology	45–50% (McGee and Germov, 2009; West et al., 2013)	Canada	Assistant: 52.9% Associate: 45.1% Full: 33.6% (Statistics Canada, 2025)
		Switzerland	30% (2021-23) (Swiss Universities, n.d.)
		Netherlands	29.9% (Dutch Network of Women Professors, 2025)
		Australia	Senior Positions: 31% (Winchester and Browning, 2015)

Table adapted from Authors (2024). Inclusion of countries based on presence in corpus and information availability. Definition of ‘full professorships’ may vary regionally.

C: Coherence Measure from Eklund and Forsman (2022)

We have adopted Eklund and Forsman’s (2022) measure for topic coherence.

“To assess whether the topic model produced coherent topics. Our definition of evaluator determined coherence score (Coh) is:

$$Coh = 1 - \frac{n_{misplaced}}{n_{articles}}$$

where $n_{articles}$ is the number of articles evaluated in the topic and $n_{misplaced}$ is the number of articles that the evaluators found was misplaced into that topic. We call a topic coherent if $Coh \geq 0.8$. This threshold at 80% is where we consider a topic *coherent* enough for being useful in an industrial application. Further, a topic that has at least one evaluator labeling it *Incoherent* will be considered incoherent, regardless of the opinions of other evaluators.” (Eklund and Forsman, 2022: 648)

Undertaking the process meant a total of 185 articles (27.7%) of all articles were manually reviewed for fit, with 93.5% ($n = 173$) of manually reviewed articles fitting into their BERTopic assigned cluster, giving us a high confidence of BERTopic’s clustering coherency.

Individual files can be found in the Github repository.

D: Binomial Probability - Gender Sorting in Teams

This appendix documents the procedure used to derive the predicted (random-mixing) and observed distributions of gender composition in multi-authored teams of three or more authors. This allows us to draw direct comparison between the observed team compositions and those expected under random gender mixing, conditional on the overall gender composition of the authorship pool within teams, and the observed team-size distribution.

Predictions are based on the overall gender composition of authorships in teams. Across these teams, women and non-binary (FNB) authors constitute:

$$p_n = 0.3558$$

and male authors constitute:

$$p_m = 1 - p_n = 0.6442$$

These proportions are treated as the probability of randomly drawing an FNB or male author from the authorship pool.

The observed number of teams by size is presented in Table D1. A total of 130 teams had three or more authors.

Table D1. Observed number of teams by size.

Team Members	Frequency
3	78
4	24
5	12
6	5
7	6
8	3
9	1
10	1
Total:	130

For each team size n , the probability of observing k FNB authors under random mixing is calculated using the binomial distribution:

$$P(k | n) = \binom{n}{k} p_n^k \times (1 - p_n)^{n-k}$$

where $p_n = 0.3558$.

Teams are grouped into five mutually exclusive categories based on the share of FNB authors:

All male: $k = 0$

All FNB: $k = n$

Male-dominant: $0 < k/n < 0.40$

Parity: $0.40 \leq k/n \leq 0.60$

FNB-dominant: $0.60 < k/n < 1$

Because possible gender shares depend on team size, the parity category

($0.40 \leq k/n \leq 0.60$) corresponds to the following k values:

n = 3: none

n = 4: k = 2

n = 5: k = 2 or 3

n = 6: k = 3

n = 7: k = 3 or 4

n = 8: k = 4

n = 9: k = 4 or 5

n = 10: k = 4, 5, or 6

For each team size, binomial probabilities were summed within each category and multiplied by the observed number of teams of that size. Predicted counts were then aggregated across all team sizes to produce overall expected values for: all male teams, male-dominant teams, parity teams, FNB-dominant teams, and all FNB teams.

Observed counts were constructed from the distribution of teams by team size and percentage of women/FNB authors. Each team was classified using the same category thresholds described above and summed across team sizes.

Team Composition	Authorships (n)	Male authors (n)	FNB authors (n)	Actual (n)	Expected (n)	Difference (%)	Difference (n)
All male	104	104	0	29	27.1	+ 7%	-4.83
Male dominant	240	171	69	61	56.1	+ 9%	2.67
Parity	45	22	23	9	19.0	- 53%	-7.31
FNB Dominant	95	29	66	25	23.9	+ 5%	6.10
All FNB	21	0	21	6	4.0	+ 51%	3.36
<i>Grand Total</i>	<i>505</i>	<i>326</i>	<i>179</i>				

Positive deviations for gender-skewed and single-gender teams indicate systematic gender clustering in collaborative authorship rather than random team formation.
